Installation Requirements

- ▶ Download and install Meteor: <https://www.meteor.com/>
- ▶ Download and install Git: <https://git-scm.com/>

Just a small little problem...

Hi there,

As we mentioned last week, Meteor Development Group will be retiring the legacy Meteor.com free hosting service on March 25, 2016.

How do I migrate my Meteor.com app to another hosting service?

Before **March 25, 2016 12pm PDT**, please migrate your app from the free Meteor.com hosting service to another app hosting platform to ensure continued availability of your app. You will also have until **April 15, 2016 12pm PDT** to retrieve data from your app's Mongo database. Here are specific instructions on how to migrate your Meteor app as well as access your data from the Meteor.com free hosting service.

If you want stable, pay-as-you-go hosting for your Meteor app, we recommend using Galaxy (pricing starts at USD \$0.035 per container hour). If you signup for a new Galaxy account and migrate your app by March 25, you'll receive a \$25 credit / use promo code

Summary

- ▶ Meteor is (was) a complete platform for building web and mobile apps in pure JavaScript.
- ▶ To install the environment necessary to run this program, the code must be migrated to another web application and hosting service. The Meteor packages and libraries can work on other platforms if correctly set up.

Summary cont.

- ▶ Since the Meteor automatic database installation & connection is only available for the Meteor platform, a new database will have to be created and connected to the code....manually.
- ▶ For more information regarding what Meteor used to be and to better understand what is written in our code, feel free to visit <http://docs.meteor.com/#/basic/> before it is removed from the web.
- ▶ Good luck.
